identity

CORPORATE DATA PROTECTION

Data Loss Prevention System (DLP)

Control of data transfer channels, insider detection and incident investigation

IDENTITY LLC · +998 78 555-11-75 · identity-uz.com

CONTEXT

Data leaks — a growing threat to business

60%

of breaches involve the human factor

$4.92 M

breach cost caused by a malicious insider — the costliest scenario

241 days

on average to identify and contain a breach

$4.44 M

average cost of a data breach worldwide

53%

of breaches involve customer personal data

CONSEQUENCES

What a company loses in a leak

- **Growing financial losses**
- **Reputational risks and loss of customer trust**
- **Fines of up to 200 BCA for data law violations**
- **Heavy workload on IT and security teams**

identity

REGULATION

Legal requirements

Law of the Republic of Uzbekistan “On Personal Data”

No. ZRU-547 of 02.07.2019 · in force since 01.10.2019 · as amended in 2026

Article 27: data owners and operators must take legal, organizational and technical measures to ensure the safety and confidentiality of data

DLP is a technical data protection measure

Open on lex.uz

INDUSTRY REQUIREMENTS: BANKS

CBU Regulation on minimum information security and cybersecurity requirements (reg. No. 3669) — DLP is mandatory, cl. 59 and 89

Open on lex.uz

Regulation on measures and sanctions (reg. No. 3492, as amended by No. 3492-1) — fine of 0.3% of bank capital for lacking DLP, cl. 11.14

Open on lex.uz

DLP HELPS YOU COMPLY WITH

- Protection of customer and employee personal data
- Control over transfers of confidential information
- Data stays inside the company (on-premise)
- Collecting evidence for audits and investigations
- Industry regulator requirements — e.g., the Central Bank for banks

identity

PROTECTED ASSETS

What DLP protects in a company

Customer base

Contacts, deal history and terms of work with customers

Personal data

Passport data, PINFL, contacts of customers and employees

Trade secrets

Strategy, prices, partnership terms, know-how

Financial documents

Reports, budgets, payment and accounting data

Tenders and contracts

Tender documents, commercial proposals, contracts

Source code and IT data

Code, configurations, drawings and project documentation

identity

INDUSTRIES

Which industries it serves

Banking and finance

Banking secrecy, card and account data, Central Bank requirements

Public sector

Official information and citizens' personal data

Telecom

Subscriber data, billing, traffic data

Manufacturing

Drawings, production technologies, tender documents

Retail and e-commerce

Customer bases, loyalty programs, pricing policy

IT and software development

Source code, infrastructure access, project documentation

identity

SCENARIOS

Typical leak scenarios

A manager exports the customer base before resigning

DLP → Detecting employees preparing to leave, USB and cloud storage control

Tender documents leak to a competitor

DLP → Email and messenger control, document citation detection, blocking

Drawings and project files are copied to USB

DLP → External device control, blocking or quarantining transfers

An employee is affiliated with a supplier

DLP → Conflict of interest search, link graph, monitoring of deal communications

Kickbacks and bribes in procurement

DLP → Detecting signs of fraud, theft, extortion and bribery

Printing or screenshots of confidential data

DLP → Control of printing, screen sharing and screenshots with text recognition

identity

HOW IT WORKS

How a DLP system works

01

Interception

across communication channels

- Corporate email and webmail
- Messengers, video conferencing
- Printing and removable media
- Web requests, online posts
- File resources

02

Filtering

by policy rules

- Content and attribute analysis
- Comparison with company policies
- Violation → security event
- Compliant → transfer allowed

03

Response

events and incidents

- Viewing events by severity
- Escalating an event to an incident
- Incident investigation
- Analysis of person and group profiles
- Communication archive analysis

Response modes

Blocking

Quarantine

Redaction

Monitoring

identity

ARCHITECTURE

Architecture and scalability

identity

INTERCEPTION MODULES

All leak channels under control

Corporate email

- Mail server monitoring
- Blocking suspicious emails
- Quarantine
- Redaction — removing confidential parts

Network traffic

- Websites and web forms
- External email and webmail
- Social networks, forums, blogs
- Video and photo hosting, clouds

Workstations

- Messengers and video conferencing
- Printing
- Keyboard and clipboard
- Application launches
- Cloud storage and FTP
- External devices
- Search queries and web
- Wi-Fi connections
- Screen: sharing and recording
- Microphone recording
- Working time control

File storage

- Local and corporate storage
- Cloud storage
- File access control and audit

identity

ANALYSIS TECHNOLOGIES

How DLP finds confidential data

Attachment format

By extension and by content

Message attributes

Sender, recipients, subject, channel

Citation

Full or partial match with a reference

Identifiers

Passport, TIN, card and account numbers

Patterns (RegEx)

Flexible patterns for company data

Classifier

Preset and custom information categories

Recognition

Text in photos and scans, speech to text

All event types

Email, messengers, printing, keystrokes

identity

INVESTIGATION

360° analysis: the full picture of an incident

Data context

What exactly leaked?

Confidentiality level and data type: personal data, trade secrets, source code

Transfer channels

How did the data leave?

Email, messengers, web forms, clouds, printing, screenshots, USB

User context

Who performed the action?

Position, access rights, violation history, trust level based on UBA

Relationship graph

Accomplices inside the company and external recipients

Timeline

What happened before and after?

Websites visited, mass file copying, similar transfers

identity

BEHAVIOR ANALYTICS

Detecting insiders and fraud

Behavior analysis (UBA)

- Real-time analysis of a person's behavior
- Individual behavior profile
- Comparing the behavior of several persons
- Analysis of deviations from the norm
- Pattern-based profiling

Advanced analytics

- Trust level for each person
- Person's link graph
- Suspicious actions of a person
- Summary report: communications, contacts, actions
- Special monitoring groups

DLP DETECTS

- Insiders and industrial espionage
- Conflicts of interest and affiliation
- Corporate fraud
- Theft, extortion and bribery
- Compromising connections
- Disloyal employees and sabotage
- Employees preparing to leave

Monitoring is carried out within the law and the company's internal policies

identity

INVESTIGATION

Investigation, archive and reporting

The DLP system is the main source of information about an incident and its circumstances

1. Incident detection in the DLP system
2. Opening an investigation, case card
3. Assigning a case owner, granting access
4. Collecting and analyzing evidence
5. Recording results, case report
6. Regular reporting for management

Investigation module

Secure case storage, access rights, automatic report

Archive up to 10 years

Operational and long-term archive, multiple storages

Search and reports

Full-text search, incident and person reports, heat map

identity

RESULTS

What the company gets

01

Legal compliance

Personal data protection and meeting industry regulator requirements

02

Trade secret protection

Control of every channel through which confidential data can leave the company

03

Control of personnel risks

Early detection of insiders, fraud and conflicts of interest

04

Evidence base

10-year archive, link graph and ready-made reports for investigations

05

Unified network control

HQ, branches and divisions under unified policies

06

Process transparency

Real-time picture of processes and performance reporting

identity

Why implement DLP with IDENTITY

IDENTITY ECOSYSTEM

DLP is one layer of comprehensive protection

- Biometric identification
- Video analytics
- Anti-fraud
- EDR — workstation protection
- **DLP — leak prevention**
- IPS / IDS
- WAF and Anti-DDoS
- Code security (SAST / DAST)

Local team

On-site implementation and support, expertise in ZRU-547 and regulator requirements

Full cycle

From assessment and design to implementation, training and support

Tailored to your business

Policies and scenarios for your processes and industry specifics

One partner — many layers

DLP is complemented by other IDENTITY solutions

Help with DLP legitimization

We prepare documents for lawful DLP use: monitoring policy, employee notices and consents, amendments to employment contracts and internal regulations

identity

IMPLEMENTATION

Implementation stages

01

Assessment

Analysis of information flows, channels and protected data, risk assessment

02

Design

Solution architecture, security policies and information classifier

03

Pilot

Testing the system on the company's real scenarios

04

Deployment

Installation, infrastructure integration and policy fine-tuning

05

Support

Security officer training, support and policy updates

DELIVERABLES

- **Configured system**
- **Policies for your data**
- **Trained security team**
- **Support and development**

identity

NEXT STEPS

Ways to get to know the system

OPTION 1

Demo environment

Exploring the system’s features and interface

Conditions

- Hosted in the vendor’s cloud
- Duration — 2–4 weeks
- Synthetic traffic

OPTION 2

Pilot on a test environment

Testing core features in near-production conditions

Conditions

- Customer traffic is not fed into the system
- No server capacity needed

RECOMMENDED

Pilot in customer infrastructure

Hands-on evaluation and solving the company’s specific security tasks

Conditions

- Effort and involvement of customer specialists
- Longer pilot duration
- Server resources for the pilot
- Infrastructure preparation
- Focus group of persons (potential violators)

identity

MULTI-BRANCH OPERATION

Branch network management

Flexible architecture

- Physical and logical data separation
- Separate or unified storage
- Optimized communication channels

Flexible policies

- Single policy for the organization
- Customizable policies for branches

Process manageability

- Monitoring across all branches
- End-to-end investigations
- Agent and role management
- Unified employee profiles

Access segregation

- HQ manages all divisions
- Local staff — only their own branch

DEPLOYMENT MODELS · one DLP system for the entire organization

Distributed

Data stored in branches, managed centrally

Combined

Shared storage plus branches with their own data

Centralized

Single storage for the entire organization

RESULTS

- Manageable, transparent security processes
- Rapid detection of violations in branches
- Centralization of security processes
