ENDPOINT PROTECTION

EDR

Detection and response to threats

Improving visibility of threats.

Detection | Investigation | Response

IDENTITY LLC · +998 78 555-11-75 · identity-uz.com

Evolution of threats

Classic antivirus (EPP)

is no longer enough.

1. Traditional threats

Malicious files and known viruses

- Infection through files, attachments and removable media
- Exploitation of known vulnerabilities and malware
- The main defence is signature-based detection

2. Advanced threats

Bypassing traditional security tools

- Exploits and new, previously unknown malware samples
- Phishing and account compromise
- Legitimate system tools used for malicious actions

3. Targeted attacks

Stealthy intrusion and development of the attack inside the infrastructure

- Stolen credentials and legitimate administration tools
- Persistence in the system and movement between devices
- Privilege escalation, data collection and preparation for theft or encryption

OBJECTIVES

Why you need EDR

1

Detection

Identifying suspicious behaviour and hidden threats

2

Investigation

Reconstructing the chain of events and finding the root cause

3

Response

Isolating devices and stopping malicious activity

4

Risk reduction

Limiting damage and improving security efficiency

IN SUMMARY

- Lower risk of downtime for critical workstations and servers
- Confidential data protected from unauthorised access and theft
- Better visibility of information security events
- Faster investigations thanks to centralised event data

identity

EDR components

Telemetry and local control

1 EDR agent

Collects data on processes, files, network and user actions

2 Telemetry collection

Records security events and sends them for analysis

3 Threat detection

Suspicious behaviour, indicators of compromise, attack techniques

Incident analysis and attack containment

4 Analytics and correlation

Links separate events into a single picture of the attack

5 Incident investigation

Timeline of events, processes, files and attacker actions

6 Threat response

Device isolation, process termination, file quarantine

7 Monitoring and reporting

Incidents, alerts, statistics and results

Administration and integration

8 Integrations

Data exchange with SIEM, SOAR, ITSM, user directories

9 Access control

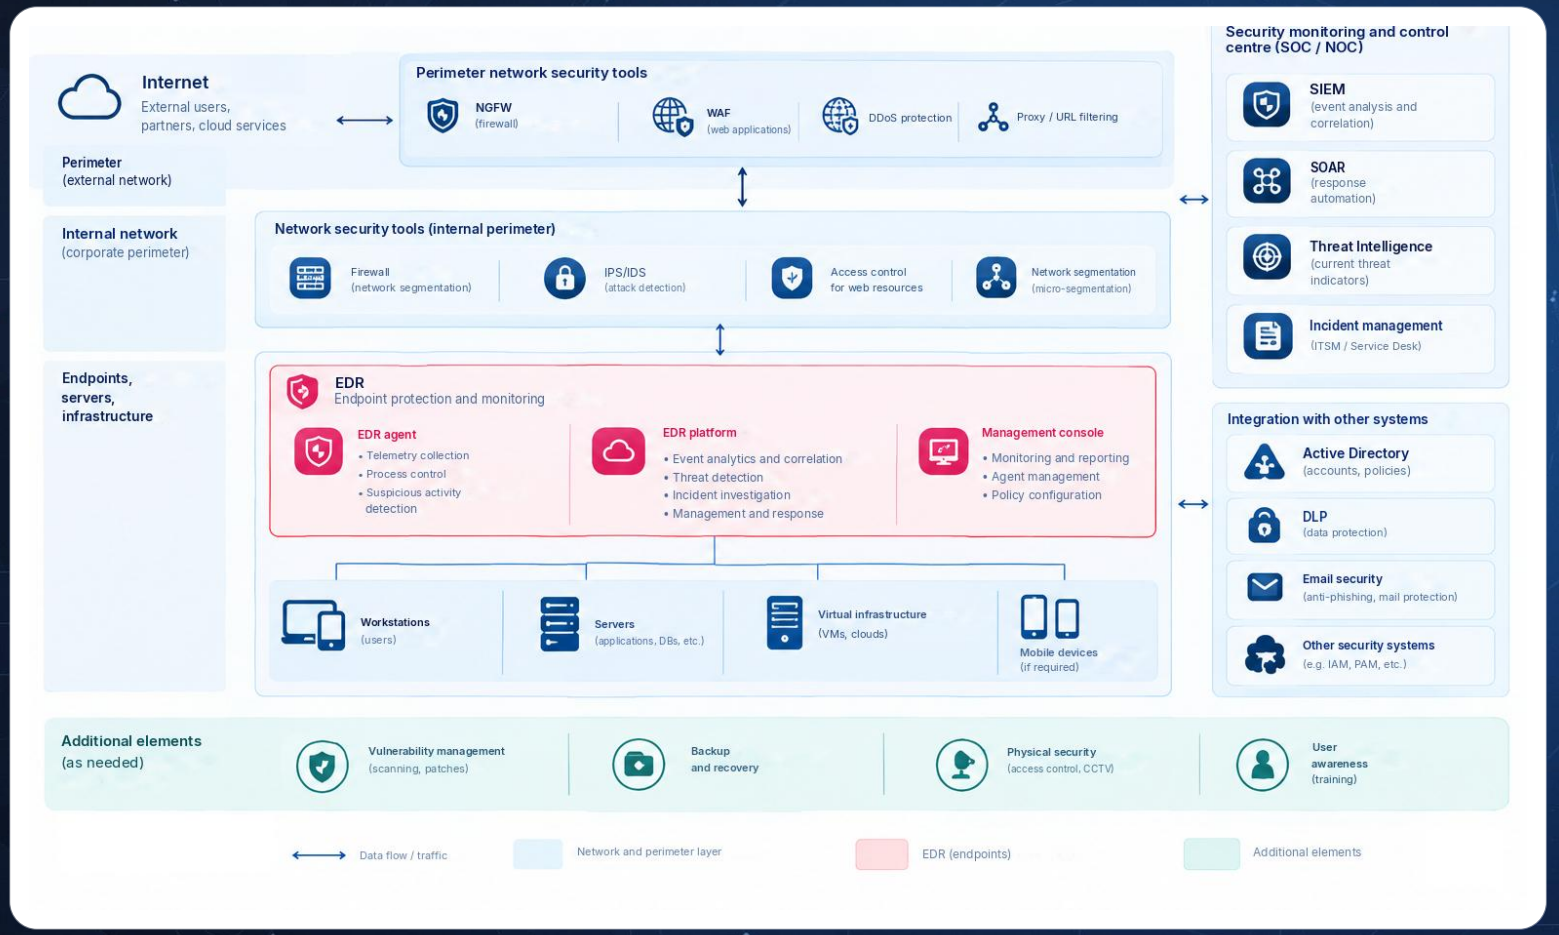

Roles, user rights, security policies, action audit

10 Centralised management

Policy setup, agent management, device status

identity

EDR in the security architecture

Perimeter and network
NGFW, WAF, IPS/IDS protect the network — but do not see what happens on the device

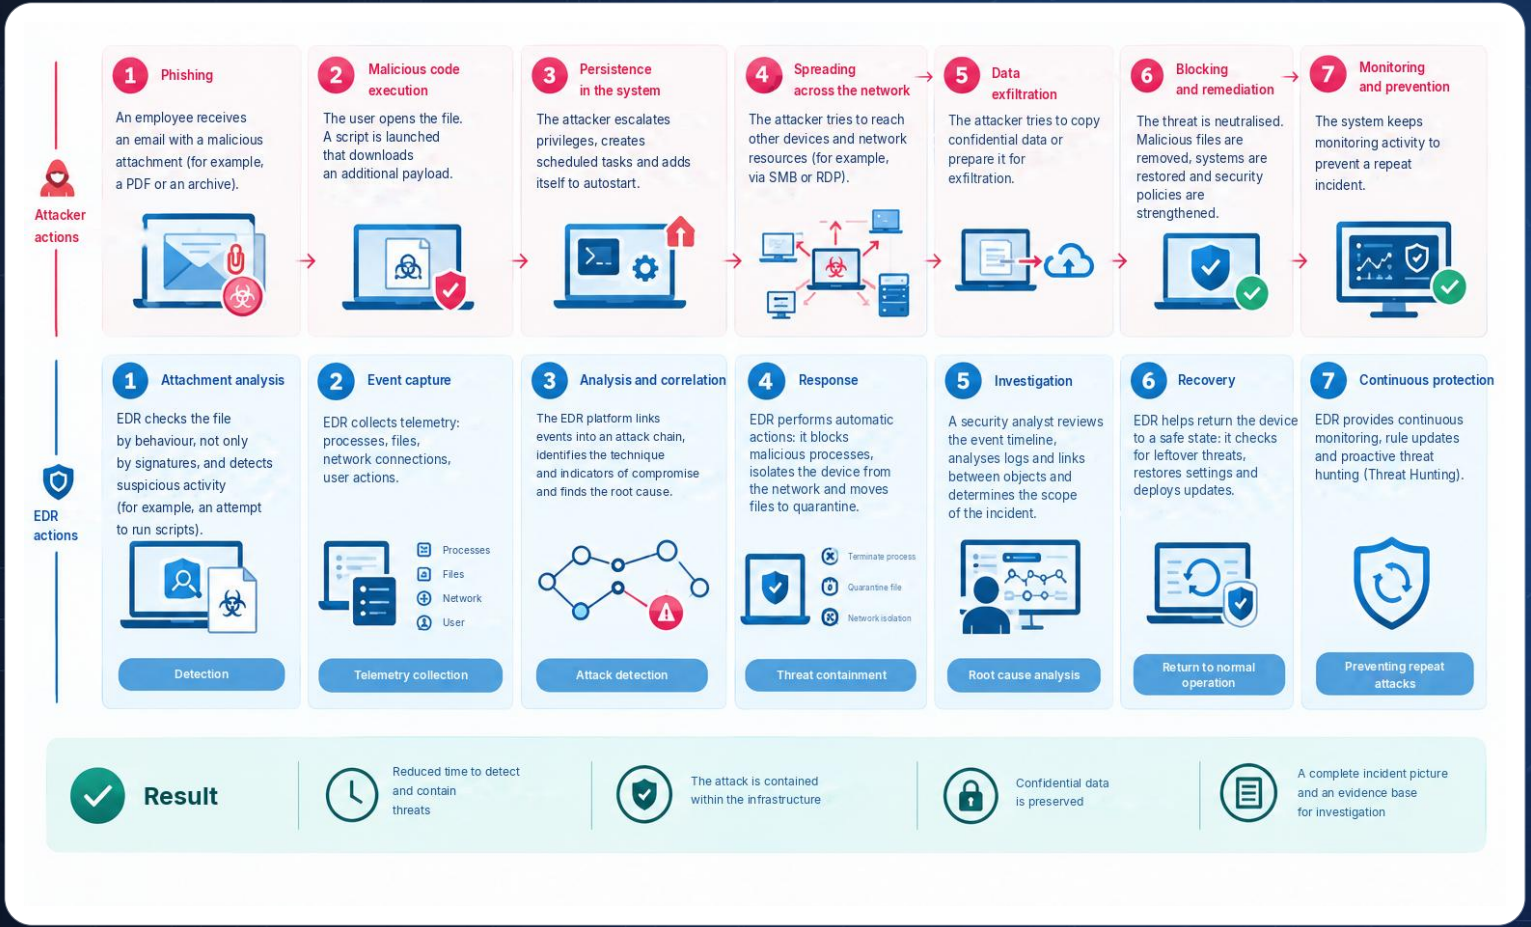

EDR — endpoints
Agent, platform and console: visibility and response on every device

SOC and integrations
SIEM, SOAR, ITSM, Active Directory, DLP — a single perimeter

identity

EXAMPLE

Attack and defence scenario

RESULT

- Less time to detect and contain a threat
- The attack is kept from spreading across the infrastructure
- Confidential data stays safe
- A full picture of the incident and an evidence base

identity

CAPABILITIES

Functional capabilities

Continuous monitoring

Uninterrupted control of endpoints

Threat detection

Including fileless attacks

Attack chain analysis

Events linked into a single picture

Investigation

Timeline and root cause of the incident

Response

Device isolation and process termination

Centralised management

Policies and agents from a single console

Integration

Data exchange with other security systems

Alerts and reports

Notifications and incident reporting

identity

KEY ASPECTS

Detection, response, manageability

Detection of new attack types

- Fileless attacks
- Ransomware
- Exploitation of vulnerabilities
- Attacks using legitimate tools (PowerShell and others)
- Attempts to steal accounts
- Persistence in the system and lateral movement

Automatic response

- Terminating a suspicious process
- Quarantining a suspicious file
- Blocking malicious files from running
- Isolating a device from the network
- Running pre-configured playbooks

Manageability

- Control of agents on endpoints
- Control of security policies
- Control of events and incidents
- Control of administrator actions

identity

IN PRACTICE

Threats and countermeasures

THREAT	EDR CAPABILITY	RESULT
Ransomware launch	Detection of suspicious behaviour, blocking or isolation	**Less potential damage**
PowerShell used in an attack	Analysis of the process and command chain	**Suspicious activity identified**
Workstation compromise	Event investigation and device isolation	**The attack is kept from spreading**
Long attacker dwell time	Threat hunting and retrospective analysis	**Previously unnoticed activity identified**

identity

VALUE

Benefits for customers

MTTD / MTTR

days → minutes

Less time to detect and respond to incidents

Less load on L1/L2

Routine analyst work is automated

Complex and targeted attacks

Detection of attacks that other tools miss

Less damage

Infected devices isolated and processes stopped

Financial and reputational risks

Minimising the consequences of successful attacks, including ransomware

Business continuity

Critical workstations and servers protected from downtime

Provable investigations

A managed process and a full picture of every incident

identity

SOLUTIONS

Proposed solutions

CHOOSING A PLATFORM

An EDR platform from a leading vendor for your infrastructure

The solution is chosen based on:

- The fleet of workstations and servers and the operating systems in use
- Deployment on the customer's servers (on-premise)
- Integration with SIEM, SOAR, ITSM and Active Directory
- Regulator requirements and internal security policies

Pilot project

Launch on a limited group of devices: effectiveness assessed on the real infrastructure

Turnkey implementation

Design, deployment, response rules and integrations, training

Support

Technical support, policy updates and help with incident investigation

identity

Implementation stages

1

Pilot project

Understanding how the system works

2

Assessment

Inventory of workstations and servers, review of existing security tools

3

Design

Deployment of the management platform, setting up interaction

4

Response rules

Incident priorities and escalation rules

5

Integration

With the existing perimeter: SIEM, SOAR, ITSM

6

Testing and acceptance

Checking how the system and response scenarios work

7

Production operation

Training, scaling to all devices, operational documentation

identity

NEXT STEPS

Ways to get to know the system

OPTION 1

Demonstration

Getting to know the capabilities and interface of the system

WHAT IS INCLUDED

- Demo on a test stand
- Walkthrough of detection and response scenarios
- Answers to questions from security specialists

OPTION 2

Pilot on a test stand

Checking key functions under controlled conditions

WHAT IS INCLUDED

- A stand with agents on test devices
- Simulation of typical attacks
- Assessment of how convenient the console is

RECOMMENDED

Pilot in the customer's infrastructure

Running on real workstations and servers

WHAT IS INCLUDED

- A limited group of devices
- Real telemetry and incidents
- A final report and implementation plan
